Risk analyses and safety planning

Risk analyses make it possible to systematically estimate potential impairments in terms of frequency and the extent of damage. They serve as an important basis for decision-making when dealing with risks to people, the environment and property, as well as to organizations and companies. They also form the starting point for developing appropriate measures as part of safety planning.

We have many years of extensive experience in the development and application of risk-based approaches in the security planning process:

- Development and application of quantitative and qualitative risk analyses for people, the environment and property in a wide range of areas
- Support when it comes to the definition of protection objectives and risk assessment criteria
- Development and evaluation of efficient measures and combinations of measures to mitigate risks, including measures based on cost-effectiveness analyses
- Training and communication

Our analyses and concepts serve as a basis for rational decision-making and the most efficient use of resources.

Our customers include state, cantonal, municipal and regional authorities as well as private enterprises in Switzerland and abroad. They value our ability to solve complex challenges with innovative methods and a practical approach..
