

Data Management in Public Transport

The continuous digitalization of the railway industry underscores the need for enhanced data management, especially in the area of facilities. We support our clients with smart data management solutions, so that their processes run efficiently and reliably - without media disruptions.

We advise operators and owners of railway facilities on which data is needed, to be made available and to be maintained at which point in the lifecycle of the facility. We work with them to develop processes for efficient and secure data processing and administration.

Our services include:

- Requirements engineering
- Definition of processes and tools
- Supporting the procurement, expansion or development of suitable software
- Integration of IT solutions and development of interfaces to peripheral systems (e.g., ERP systems)
- Definition of appropriate criteria to ensure optimal data quality
